Use this area to notestorm the steps in the your users' process (i.e. what are the steps they will need to complete to accomplish their goal using your app?). Write these steps down, discuss and rearrange them until you have a refined process that will go into your journey map below.

A trend-conscious Gen Z digital native needs a way to turn their fragmented saved content into a shareable cultural object that represents who they are because text labels and rigid algorithms fail to capture the true essence of their personal style, and there's no satisfying way to present it socially.

giving access to their camera roll	giving access to their apple notes	connect with spotify	make an account	connect to pinterest	answer 2-3 quick questions of their goals
AI analysis of the information uploaded/ accessed	creates themes and clusters	generates vibe board + written explanation	like or dislike individual element	AI constructs based on feedback	share the vibe board
notification when there's a change in vibe					

Create and share a vibe board that actually represents her style

Mia, 22, college senior, East Asian, digital native. Knows her vibe is "clean girl meets vintage" but can't show it without pulling up 5 different apps.

Steps

1 Trigger	2 Download & Onboard	3 Upload content Grant access	4 Conect to Spotify	5 See Vibe Board	6 Refine	7 Share	8 Friend reacts, give feedback	9 Returns	10 update/change in vibe board

Doing

What is the user actively doing at each step?
What tools or resources is the user utilizing?
Are there any actions the user is avoiding?

Scrolling TikTok, sees someone share their Spotify Wrapped-style vibe card	Downloads app, answers 2 quick questions about what she's going for	Bulk-selects screenshots + camera roll photos	Connects account, grants permission	Scrolls through generated vibe board for the first time	Thumbs up/down elements, tweaks labels	Exports card, sends to a friend or posts on story	Reads friend's reaction, compares boards	Re-uploads new content a month later to see what changed	

Thinking

What's on the user's mind at each step?
What doubts or concerns does the user have?
What decisions is the user trying to make?

"Wait this is actually cool, I want one"	"Is this going to be another app that just gives me generic results?"	"Which photos actually represent me vs. just things I saved randomly?"	"Is it going to judge me for my guilty pleasure playlist?"	"Does this actually look like me? Or is this just an AI making stuff up?"	"How do I make this feel more accurate without spending 30 minutes on it?"	"Will people think this is cringe or will they get it?"	"Is her vibe similar to mine? What does that say about us?"	"Wow my taste actually shifted — I didn't realize that until now"	

Feeling

What emotions is the user experiencing in each step?
How does the user's emotional state affect their actions?
Are these feelings positive, negative, or neutral?

😕 Curious, slightly envious	😐 Skeptical but willing to try	😵‍💫 Slightly overwhelmed, self-conscious about what to pick	😬 Mildly anxious (vulnerable data)	😨 Either "omg this is so me" or immediate distrust	😌 Sense of ownership and control	🤩 Excited but slightly vulnerable	😄 Validated, curious, want to compare more	🥹 Nostalgic, sense of growth	

Opportunities

How might we mitigate some of the potential pain points?

Make the shareable card so visually distinctive that it's recognizable in the wild — like Wrapped	Set expectations early: "this isn't a quiz, it learns from what you actually saved"	Bulk select UI, smart suggestions ("these 12 photos seem style-related") to reduce friction	Show preview of what data is being pulled before committing — builds trust	First reveal needs to feel like a moment. Animation, good typography, beautiful layout	Keep refinement to max 5 taps — don't make it feel like work	Multiple format options (story, DM card, link) + make it feel like sending something cool, not an ad	Enable friend comparison in-app so reaction doesn't die in DMs	Push notification: "your vibe has evolved — see what changed"
